Subject Adding User Tapes to the ATL

Hi,

I think I have clarified the process below:

Adding a USER cart to the ATL

****NOTE**** where you see xxxxxx, this indicates the VOLSER.

(1) If the tapes have already been added with TT racks:

Delete/Redefine RMM entry so it had the same RACK number as VOLSER (required for library resident tapes) rather than a TTxxxx rack

OR

(2) If the same volser already exists in the ATL:

Eject the tape from AAZD via the syslog using:
/LI E,xxxxxx,P

Once ejected, remove from RMM all together using this command:
TSO RMM DV xxxxxx FORCE

Have JAV return to Technical Manuals Librarian

OTHERWISE

When these tapes are entered into the ATL, you MUST check where they are allocated immediately - if they are allocated to any other system other than AAZD, they get allocated as SCRATCH and can be overwritten!

Start here if the above two steps do not need to be performed:

- Add the tapes to RMM as normal, but using RACK numbers the same as the VOLSER.
- Alter the location of the cart(s) to BHATL3 to become INTRANSIT:YES with this command:
TSO RMM CV xxxxxx LOCATION(BHATL3)
Get JAV to enter the cart(s) into BHATL3
- Go to ISMF, option 2.3. Enter the VOLSER of the cart(s) to see if they have been allocated a volume entry - if it is not there, the cart may have allocated to AAIA or AAAN. Check those two systems for the volume entry of the cart(s) that you added. If they are allocated to a system other than AAZD, you must delete the VOLENT from there and redefine on AAZD:
- Delete the VOLENT from the system with an IDCAMS job (there is usually a job in DASDADM.LOC.CNTL(VOLENT):
DELETE Vxxxxxx VOLENT
- Delete the RMM entry from the system with command AFTER the volent has been deleted:
TSO RMM DV xxxxxx FORCE
- Now go to AAZD and define the VOLENT with IDCAMS:
CREATE VOLUMEENTRY(NAME(Vxxxxxx) LIBRARYNAME(BHATL3) -
USEATTRIBUTE(PRIVATE) NOWRITEPROTECT MEDIATYPE(MEDIA3) -
LOCATION(LIBRARY))
- Done

The user may get an SMS error when trying to access the tape, change the volent with - ALTER
Vxxxxxx VOLENT SATTR(RDCOMPAT)

This tape could have been easily added to either AAIA or AAAN - so you have to logon to each of
these before the tape is inserted to locate which system it gets allocated to. Of course if it allocates to
AAZD then you have no further action to take.

Regards,

Bruce Terry
